

Extra layer
of added
protection for
employees

As businesses return to work, they will be looking for ways to protect their employees. Innovation has come in the form of thermal technology that could help minimise the impact of Covid-19.

Thermal Technology

This new technology from global leader Dahua can measure the body temperature of large groups of people and report on the results daily. The initial product was sent to China in January of this year and has now been deployed around the world and is in place on thousands of sites globally.

Efficient Method

To measure the temperature of 5,000 people using a traditional thermometer would take over 4 hours, this system will take 30 minutes.

- Highly accurate, measures from 3m
- Can read up to 30 faces concurrently
- Has a 1.5 metre field of view.
- Accurate results
- Contactless method

Using such a system in a work environment will give the employees peace of mind and contribute to keeping them healthy.
